Lecture 25. Recursively Defined Structures

Recursive Definition

- Recursion is also useful for many problems that do not involve numbers.
- In general, a recursive definition of a given object ¹ is made up of two parts:
 - B. Base step defines the simplest possible object that doesn't depend on anything else, and
 - R. Recursive step defines more complicated objects recursively that depend on simpler cases

¹An object could be a number, a mathematical structure, a function, or almost anything else we want to describe.

- **Example 25.1.** A sequence of symbols written together in some order is called a string. λ represents the empty string, and we do not write λ after it has been introduced with another string; for example, $\mathbf{cubs}\lambda = \mathbf{cubs}$. A special kind of string called a palindrome 2 can be defined as follows.
 - **B1.** λ is a palindrome. (Why do we need to define this? Think about forming 'otto') **B2.** Any symbol a is a palindrome.
 - **R.** If x and y are palindromes, then yxy is a palindrome.
- We can build up the palindrome racecar from the definition as follows.

²Any word that is the same forward as backward, such as racecar or HANNAH

- **Example 25.1.** A sequence of symbols written together in some order is called a string. λ represents the empty string, and we do not write λ after it has been introduced with another string; for example, $\mathbf{cubs}\lambda = \mathbf{cubs}$. A special kind of string called a palindrome 2 can be defined as follows.
 - **B1.** λ is a palindrome. (Why do we need to define this? Think about forming 'otto')
 - B2. Any symbol a is a palindrome.R. If x and y are palindromes, then yxy is a palindrome.
- We can build up the palindrome racecar from the definition as follows.
 - 1) Since it is a symbol, e is a palindrome by B2.

²Any word that is the same forward as backward, such as racecar or HANNAH

- Example 25.1. A sequence of symbols written together in some order is called a string. λ represents the empty string, and we do not write λ after it has been introduced with another string; for example, ${\bf cubs}\lambda={\bf cubs}$. A special kind of string called a palindrome 2 can be defined as follows.
 - **B1.** λ is a palindrome. (Why do we need to define this? Think about forming 'otto')
 - **B2.** Any symbol a is a palindrome.
 - **R.** If x and y are palindromes, then yxy is a palindrome.
- We can build up the palindrome racecar from the definition as follows.
 - 1 Since it is a symbol, e is a palindrome by B2.
 - 2 Similarly, c is a palindrome.

²Any word that is the same forward as backward, such as racecar or HANNAH

- Example 25.1. A sequence of symbols written together in some order is called a string. λ represents the empty string, and we do not write λ after it has been introduced with another string; for example, ${\bf cubs}\lambda={\bf cubs}$. A special kind of string called a palindrome 2 can be defined as follows.
 - **B1.** λ is a palindrome. (Why do we need to define this? Think about forming 'otto')
 - **B2.** Any symbol a is a palindrome.
 - **R.** If x and y are palindromes, then yxy is a palindrome.
- We can build up the palindrome racecar from the definition as follows.
 - 1 Since it is a symbol, e is a palindrome by B2.
 - 2 Similarly, c is a palindrome.
 - 3 Using R, cec is a palindrome.

²Any word that is the same forward as backward, such as racecar or HANNAH

- Example 25.1. A sequence of symbols written together in some order is called a string. λ represents the empty string, and we do not write λ after it has been introduced with another string; for example, ${\bf cubs}\lambda={\bf cubs}$. A special kind of string called a palindrome 2 can be defined as follows.
 - **B1.** λ is a palindrome. (Why do we need to define this? Think about forming 'otto')
 - **B2.** Any symbol a is a palindrome.
 - **R.** If x and y are palindromes, then yxy is a palindrome.
- We can build up the palindrome racecar from the definition as follows.
 - 1 Since it is a symbol, e is a palindrome by B2.
 - 2 Similarly, c is a palindrome.
 - 3 Using R, cec is a palindrome.
 - 4 By B2, a is a palindrome.

²Any word that is the same forward as backward, such as racecar or HANNAH

- Example 25.1. A sequence of symbols written together in some order is called a string. λ represents the empty string, and we do not write λ after it has been introduced with another string; for example, $\mathbf{cubs}\lambda = \mathbf{cubs}$. A special kind of string called a palindrome 2 can be defined as follows.
 - **B1.** λ is a palindrome. (Why do we need to define this? Think about forming 'otto')
 - **B2.** Any symbol a is a palindrome.
 - **R.** If x and y are palindromes, then yxy is a palindrome.
- We can build up the palindrome racecar from the definition as follows.
 - ① Since it is a symbol, e is a palindrome by B2.
 - 2 Similarly, c is a palindrome.
 - 3 Using R. cec is a palindrome.
 - 4 By B2, a is a palindrome.
 - **5** By R, aceca is a palindrome.

²Any word that is the same forward as backward, such as **racecar** or **HANNAH**

- Example 25.1. A sequence of symbols written together in some order is called a string. λ represents the empty string, and we do not write λ after it has been introduced with another string; for example, $\mathbf{cubs}\lambda = \mathbf{cubs}$. A special kind of string called a palindrome 2 can be defined as follows.
 - **B1.** λ is a palindrome. (Why do we need to define this? Think about forming 'otto')
 - **B2.** Any symbol a is a palindrome.
 - **R.** If x and y are palindromes, then yxy is a palindrome.
- We can build up the palindrome racecar from the definition as follows.
 - 1 Since it is a symbol, e is a palindrome by B2.
 - 2 Similarly, c is a palindrome.
 - 3 Using R, cec is a palindrome.
 - 4 By B2, a is a palindrome.
 - 5 By R, aceca is a palindrome.
 - 6 By B2, r is a palindrome.

²Any word that is the same forward as backward, such as racecar or HANNAH

- Example 25.1. A sequence of symbols written together in some order is called a string. λ represents the empty string, and we do not write λ after it has been introduced with another string; for example, ${\bf cubs}\lambda={\bf cubs}$. A special kind of string called a palindrome 2 can be defined as follows.
 - **B1.** λ is a palindrome. (Why do we need to define this? Think about forming 'otto')
 - **B2.** Any symbol a is a palindrome.
 - **R.** If x and y are palindromes, then yxy is a palindrome.
- We can build up the palindrome racecar from the definition as follows.
 - ① Since it is a symbol, e is a palindrome by B2.
 - 2 Similarly, c is a palindrome.
 - 3 Using R, cec is a palindrome.
 - 4 By B2, a is a palindrome.
 - 5 By R, aceca is a palindrome.
 - 6 By B2, r is a palindrome.
 - 1 Using R, racecar is a palindrome.

²Any word that is the same forward as backward, such as racecar or HANNAH

Practice 25.2. Define a set (or collection) X of strings in the symbols 0 and 1 as follows.

B. 0 and 1 are in X.

R1. If x and y are in X, so is xxyy.

R2. If x and y are in X, so is xyx.

- (a) Explain why the string $01001011 \in X$ using the definition. Build up the string step by step, and justify each step by referring to the appropriate part of the definition.
- (b) Use the induction method to prove that, if x is in X, then x has exactly the same number of 0s and 1s.
- (c) Find a string in the symbols 0 and 1 that has the same number of 0s and 1s, but is not in X.

Python Code for Palindrome Testing

- **B1.** λ is a palindrome.
- **B2.** Any symbol a is a palindrome.
 - R. If x and y are palindromes, then yxy is a palindrome.

```
def isPalindrome(s):
   """Assume s is a string
      Returns True if s is a palindrome: False otherwise.
       Punctuation marks, blanks, and capitalization are
       ignored """
   def toChars(s):
       s = s.lower()
        letters = ''
        for c in s:
           if c in 'abcdefghiiklmnopgrstuvwxvz':
                letters = letters + c
       return letters
   def isPal(s).
       print (' isPal called with', s)
       if len(s) <= 1:
            print (' About to return True from base case')
            return True
       else:
            answer = s[0] == s[-1] and isPal(s[1:-1])
           print (' About to return', answer, 'for', s)
            return answer
   return isPal(toChars(s))
```

```
def testIsPalindrome():
    print ('Try racecar')
    print (isPalindrome("racecar"))
    print ('Try AURAK')
    print ('Try AURAK')
    print (isPalindrome('AURAK'))
    print (isPalindrome('AURAK'))
    print('Doc Note: I dissent. A fast never prevents a fatness.I diet on cod.")
    print ('SPalindrome("Doc Note: I dissent. A fast never prevents a fatness.I diet on cod."))
testIsPalindrome()
```

Recursive Geometry

Example 25.3. The Koch snowflake fractal. Define a sequence of shapes as follows.

- **B.** K(1) is an equilateral triangle.
- **R.** For n > 1, K(n) is formed by replacing each line segment

of K(n-1) with the shape

Construct K(1), K(2), K(3), etc.

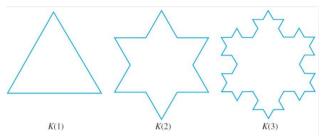

Figure 3.7 The curves K(1), K(2), and K(3).

Figure 3.8 The Koch snowflake fractal.
